

BitMine

Launch guide: Play Store, purchases and withdrawals

Every step, in order. Written 4 October 2026 for app build 35 (version 1.0.0).

What	Value
App package name	com.bitmine.app
Server (API)	https://bitmine.webflowby.online
Admin panel	https://bitmine.webflowby.online/admin/login (admin@bitmine.com)
Files to upload	D:\BitMine\BitMine-1.0.0-build35.aab (Play Console) and docs\store\play-icon-512.png (store icon)
Signing key (never lose it)	D:\BitMine\frontend\android\bitmine-release.jks and keystore.properties
Code	https://github.com/nitishbhardwaj-7/BitMine

How to read this guide. Parts A to D are needed to sell and pay out. Do them in order: Part A gets the app into Play Console, Part B makes purchases work, Part C makes withdrawals work, Part D gets real ads. Part E is optional. Part F is the final launch checklist. Steps marked **[Claude]** are done by Claude in a chat: you only hand over the value mentioned.

The order of work

#	Part	Why it comes at this point	Rough time
A	Play Console: account, app, first upload	Google only lets you create purchase products after a build is uploaded.	1 day + Google's account checks
B	Purchases: Play products + RevenueCat	The RevenueCat key is built into the app, so a new build is needed after this.	Half a day
C	Withdrawals: Speed wallet	Independent of the app build. Can be done any time.	1 hour + Speed's verification
D	Ads: AdMob	Real ads fill reliably only once the app is listed on Play.	30 minutes
E	Optional: push notifications, Google sign-in, banner ads	Nice to have. Not needed to launch.	1 to 2 hours
F	Test everything, then go to Production	Google reviews the app before it is public.	Days (Google review)

Two things that can slow you down. (1) If your Play developer account is a new **personal** account, Google requires a closed test with at least 12 testers for 14 days before you may publish to Production. An organisation account does not have this rule. (2) Google reviews crypto-related and "earn money" apps more strictly. Describe the app honestly as cloud-mining rewards paid in Bitcoin, never promise income, and complete the Financial features declaration (Part A, step 9).

Part A - Play Console: account, app and first upload

A1. Developer account

1. Go to **play.google.com/console** and sign in with the Google account that should own the app.
2. Pay the one-time 25 USD registration fee and complete identity verification. Choose **Organisation** if you have a registered business (it avoids the 12-tester rule above), otherwise **Personal**.
3. Wait for Google to verify the account (often 1 to 3 days).

A2. Create the app

1. Play Console > **Create app**. Name: BitMine. Default language: English. Type: **App**. Free or paid: **Free**. Accept the declarations.
2. The package name is fixed by the first file you upload: it will be **com.bitmine.app**.

A3. Upload the first build (Internal testing)

1. Left menu > Testing > **Internal testing** > Create new release.
2. When asked about app signing, keep **Play App Signing** switched on (Google's recommendation).
3. Upload **D:\BitMine\BitMine-1.0.0-build35.aab**. Release name: 1.0.0 (35). Save, then **Review release** and **Start rollout to Internal testing**.
4. Open the **Testers** tab, create an email list containing your own Gmail address, save, and open the opt-in link on your phone to join the test.

Every later upload must have a higher build number than the last one. Claude numbers builds automatically (35, 36, ...). Never upload an older number.

A4. Store listing and required forms

Play Console > **Dashboard** shows a list titled "Set up your app". Complete every item:

1. **Privacy policy:** you need a public web page with your privacy policy. Paste its link here, and also in the admin panel > FAQs & app > Privacy URL (and Terms URL).
2. **App access:** choose "All or some functionality is restricted" and give Google a test login (create a normal account in the app with an email you control, and enter its email and password here).
3. **Ads:** Yes, the app contains ads.
4. **Content rating:** fill in the questionnaire honestly (no violence, no gambling: nothing is staked in the games).
5. **Target audience:** 18 and over.
6. **Data safety:** declare that the app collects email address and name (account), purchase history, app activity and device identifiers (ads, AdMob), that data is encrypted in transit, and that users can request deletion. Account deletion exists in the app (Settings > Delete Account). Google also asks for a web link where a user can request deletion: use a page or your support email page.
7. **Government apps / News apps / Health:** No.
8. **Advertising ID:** Yes, used for advertising (AdMob).
9. **Financial features** declaration: declare that the app does not provide loans, banking or trading. If asked about cryptocurrency: it is not an exchange or a wallet for trading; rewards are paid out in Bitcoin over Lightning.
10. **Main store listing:** app name, short description (80 characters), full description, the icon **docs\store\play-icon-512.png**, a feature graphic (1024 x 500) and at least 2 phone screenshots. Category: Finance or Tools.

Part B - Purchases (Google Play Billing + RevenueCat)

How it works: Google Play takes the payment. RevenueCat confirms to our server that the payment is real. Only then does the server add the miner or pack. The app can never grant itself anything.

B1. Payments profile

1. Play Console > Setup > **Payments profile**: create a merchant account and add your bank details. Products cannot be created without it.

B2. Create the 5 miner subscriptions

Play Console > Monetize > Products > **Subscriptions** > Create subscription. Repeat for each row. The Product ID must match **exactly**.

Product ID	Name	Price (USD) per month
bitmine_miner_mini_monthly	Mini Miner	1.99
bitmine_miner_spark_monthly	Spark	4.99
bitmine_miner_core_monthly	Core	9.99
bitmine_miner_forge_monthly	Forge	19.99
bitmine_miner_titan_monthly	Titan	79.99

1. For each subscription click **Add base plan**. Base plan ID: **monthly**. Type: **Auto-renewing**. Billing period: **Monthly**. Grace period: default.
2. Set the price (above), let Google convert it for other countries, and click **Activate** on the base plan.

B3. Create the 4 one-time products

Play Console > Monetize > Products > **In-app products** > Create product.

Product ID	Name	Price (USD)	What it gives
bitmine_super_basic	Super Miner	4.99	30 extra claims a day for 30 days
bitmine_super_pro	Super Miner Pro	49.00	50 extra claims a day for 1 year
bitmine_super_max	Super Miner Max	249.00	50 bigger claims a day for 1 year
bitmine_starter_bundle	Starter Pack	3.99	Mini Miner + Super Miner for 30 days (new users)

1. Set each product to **Active**.

Prices shown inside the app come from Google Play once this is set up. If you change a price in Play Console, also change the display price in the admin panel > Products so the two match.

B4. RevenueCat

1. Create an account at **revenuecat.com** and a project named BitMine.
2. Project > Apps > **+ New** > Play Store. Package name: **com.bitmine.app**.
3. RevenueCat asks for **Service Account credentials JSON**. Follow RevenueCat's own guide ("Creating Play service credentials"). In short:

- In Google Cloud Console, create a service account and download its JSON key.
 - Enable the **Google Play Android Developer API** for that Cloud project.
 - In Play Console > Users and permissions, invite the service account's email with **View financial data** and **Manage orders and subscriptions** permissions.
 - Upload the JSON in RevenueCat. It can take up to 36 hours before Google accepts the credentials.
4. RevenueCat > Products > **Import**: import all 9 products from Play.
 5. RevenueCat > Integrations > **Webhooks** > Add:
 - URL: **https://bitmine.webflowby.online/webhooks/revenuecat**
 - Authorization header: invent a long random secret (30+ characters) and keep it for step B5.
 - Events: leave all on. RENEWAL events must stay enabled (each renewal is the next month of a miner).
 6. RevenueCat > Project settings > **API keys**: copy the **public Google SDK key** (starts with goog_) and create a **secret API key** (starts with sk_).

B5. Put the keys in place

1. On the **server**, add the two secrets. From this PC (PowerShell or Git Bash), connect and open the settings file:

```
ssh -i ~/.ssh/bitmine_deploy root@201.18.192.194
nano /opt/bitmine/deploy/.env
```
2. Set these three lines (add them if missing), then save with Ctrl+O, Enter, Ctrl+X:

```
REVENUECAT_SECRET_KEY=sk_...your secret key...
REVENUECAT_WEBHOOK_AUTH=...the secret you invented in B4...
ALLOW_SANDBOX=true
```
3. Restart the server so it picks them up:

```
cd /opt/bitmine && docker compose -f deploy/docker-compose.traefik.yml --env-file deploy/.env up -d
```
4. **[Claude]** Give Claude the **public** key (goog_...). Claude builds a new app file with it. The secret keys never go in chat.
5. Upload the new .aab to Internal testing (Part A3) and install it from the Play Store test link. **Purchases only work in a copy installed from Play**, not from an APK file.

ALLOW_SANDBOX=true lets test purchases grant items. **Set it back to false before public launch** and restart, otherwise test purchases would grant real miners.

B6. Test a purchase

1. Play Console > Setup > **License testing**: add your Gmail address. Purchases by this account are free test purchases.
2. In the app: Create miner > Subscribe to Mini Miner. Complete the Google payment sheet (it shows "Test card").
3. The app should say the miner is active within a few seconds. Check the admin panel > Purchases shows it.
4. Buy Super Miner (one-time) the same way and check the extra claim track appears.

5. Test subscriptions renew every 5 minutes: after 5 minutes the miner should still be active (a second purchase row appears in admin).
6. In RevenueCat > Customers, find the test user and confirm the purchases are listed.

Part C - Withdrawals (Speed, Bitcoin Lightning)

How it works: a user requests a withdrawal once they have at least 2,500 sats. The sats are locked. You approve it in the admin panel, and the server pays it from **your** Speed wallet over Lightning. You must keep that wallet funded.

1. Create a business account at **tryspeed.com** and complete its verification (KYC).
2. Buy or deposit Bitcoin into the Speed wallet. Start small, for example 50,000 sats.
3. Speed dashboard > Developers > **API keys**: make sure you are in **Live** mode (not Test) and copy the **secret key**.
4. On the server, open the settings file and set the key, then restart (same commands as B5):

```
ssh -i ~/.ssh/bitmine_deploy root@201.18.192.194
nano /opt/bitmine/deploy/.env

SPEED_API_KEY=...your live secret key...

cd /opt/bitmine && docker compose -f deploy/docker-compose.traefik.yml --env-file deploy/.env up -d
```
5. Open the admin panel > **Dashboard**. It should now show your Speed balance. If it shows an error, the key is wrong or in Test mode.
6. Test it: in the app, an account with 2,500+ sats requests a withdrawal to your own Lightning address (for example your Speed address). The app emails a 6-digit code to confirm.
7. Admin panel > **Withdrawals** > open the request > **Approve**. Within a minute it should show **paid** and the sats should arrive.
8. Check whether Speed took its fee from the amount sent or from your wallet balance, so you know the real cost per payout.

Approval rule. Every withdrawal waits for your approval. To pay small ones automatically, set admin panel > Economics > "Auto-approve withdrawals up to (sats)". Keep it at 0 until you trust the flow. Accounts with a refunded purchase are always held for review.

If the Speed wallet runs low, payouts pause on their own and resume when you top up. A withdrawal marked **needs reconcile** means the server could not confirm the payment result: check it in Speed before approving again, so nobody is paid twice.

Part D - Ads (AdMob)

1. AdMob > Apps > BitMine > **App settings**: once the app is live on Play, link it to its Play Store listing. AdMob reviews the app; real ads fill reliably only after that.
2. AdMob > Ad units > your rewarded unit > **Server-side verification**: the callback URL must be **<https://bitmine.webflowby.online/webhooks/admob-ssv>**. This is what confirms each video to the server.
3. AdMob > Payments: add your payment details so Google can pay you.
4. To test on your own phone before ads are approved: admin panel > FAQs & app > **AdMob test devices**, add your phone's test device ID. Claude can read the ID from the phone if it is connected by USB.
5. **Before public launch, clear the test devices field.** A listed device only gets test ads, which earn nothing.

Never tap your own live ads and never ask users to tap ads. Google closes AdMob accounts for that.

Part E - Optional

E1. Push notifications (Firebase)

1. Create a project at **console.firebase.google.com**, add an Android app with package **com.bitmine.app**, and download **google-services.json**.
2. **[Claude]** Give Claude the google-services.json file: it goes into the app build.
3. Firebase > Project settings > Service accounts > **Generate new private key**. From that file put three values into the server settings file (as in B5) and restart: FIREBASE_PROJECT_ID, FIREBASE_CLIENT_EMAIL, FIREBASE_PRIVATE_KEY.

Until this is done, reminders (start mining, miner expiring) appear only inside the app.

E2. Google sign-in

1. Google Cloud Console > Credentials > create a **Web** OAuth client ID. **[Claude]** Give Claude the client ID: it is built into the app.

E3. Banner ads

1. AdMob > create a **Banner** ad unit. Paste its ID into admin panel > FAQs & app > Android banner ad unit. Banners then show on the News and Market screens.

E4. Automatic builds on GitHub

1. GitHub repo > Settings > Secrets > Actions: add the four values listed in **frontend\android\github-secrets.txt**. Without them GitHub builds cannot be uploaded to Play.

Part F - Final checks and going live

F1. Test checklist (on a phone, app installed from the Play test link)

Check	Expected result
Create an account	Verification code arrives by email; account opens on Home
Start mining	Two videos play; Home shows "Mining is running"
Claim +5.5 GH/s	Video plays; claim counter goes up by one
2x Boost	Video plays; hashrate doubles for 60 minutes
Block Miner and Hash Match	Win > video > +5.5 GH/s. Lose > video > new round
Subscribe to a miner	Google payment sheet; miner appears under Miners
Buy Super Miner	Extra claim track appears
Withdraw	Request > approve in admin > sats arrive
After midnight	Mining stops; Start is needed again

F2. Before pressing publish

1. Server: set **ALLOW_SANDBOX=false** and restart (Part B5).
2. Admin panel > FAQs & app: clear **AdMob test devices**; fill in Support email, Terms URL, Privacy URL and the Play Store URL.
3. Admin panel > Economics: confirm the numbers you want (videos to start, claims per day, minimum withdrawal).
4. Speed wallet funded; RevenueCat shows your test purchases; AdMob payment details added.
5. Back up **bitmine-release.jks** and **keystore.properties** to two safe places (for example a USB drive and a private cloud folder).

F3. Publish

1. New personal account only: run a **Closed testing** track with at least 12 testers for 14 days, then apply for production access in Play Console.
2. Play Console > Production > Create new release > **Add from library** (pick the tested build) > Review > **Start rollout to Production**.
3. Choose countries under Production > Countries/regions.
4. Google reviews the app (a few days, sometimes longer for finance and crypto apps). Answer any policy email quickly and honestly.
5. When it is live: link the app in AdMob (Part D step 1) and put the Play Store link in the admin panel.

F4. After launch: what to watch

Where	What to look at
Admin > Dashboard	Daily revenue (ads + purchases) against withdrawals; Speed balance
Admin > Withdrawals	Requests waiting for approval; anything marked "needs reconcile"

Where	What to look at
Admin > Users	Accounts flagged for review (refunds)
Admin > Economics	If payouts grow faster than revenue, lower the mining rate or claim size from a future date
AdMob and RevenueCat	Real ad earnings and purchase income (the admin ad figure is only an estimate)

Values you will hand to Claude

Value	Where it comes from	Safe to paste in chat?
RevenueCat public Google SDK key (goog_...)	RevenueCat > API keys	Yes
google-services.json	Firebase	Yes (it ships inside every app)
Google Web OAuth client ID	Google Cloud	Yes
Phone AdMob test device ID	Phone connected by USB	Yes
RevenueCat secret key, webhook secret, Speed key, Firebase private key	Their dashboards	No. Type them only into the server settings file
